Inverse Operations in Algebra

Using Division

Algebra is a type of maths where the values in an equation are unknown. The unknown part may be represented by a letter or symbol.

Our task is to find the value of the unknown.

In this case we need to find out k.

$$k \times 6 = 48$$

Our task is to find the value of the unknown.

The inverse operation of multiplication is division.

So if $k \times 6 = 48$ that means $48 \div 6$ will equal k.

If we change the equation to read like this:

$$k = 48 \div 6$$

Now we can solve it:

$$k = 8$$

Inverse Operations in Algebra

Using Subtraction

Algebra is a type of maths where the values in an equation are unknown. The unknown part may be represented by a letter or symbol.

Our task is to find the value of the unknown.

In this case we need to find out x.

$$x \quad + \quad 19 \quad = \quad 36$$

The inverse operation of subtraction is addition.

So if $x + 19 = 36$ that means $36 - 19$ will equal x.

If we change the equation to read like this:

$$x = 36 - 19$$

Now we can solve it:

$$x = \mathbf{17}$$

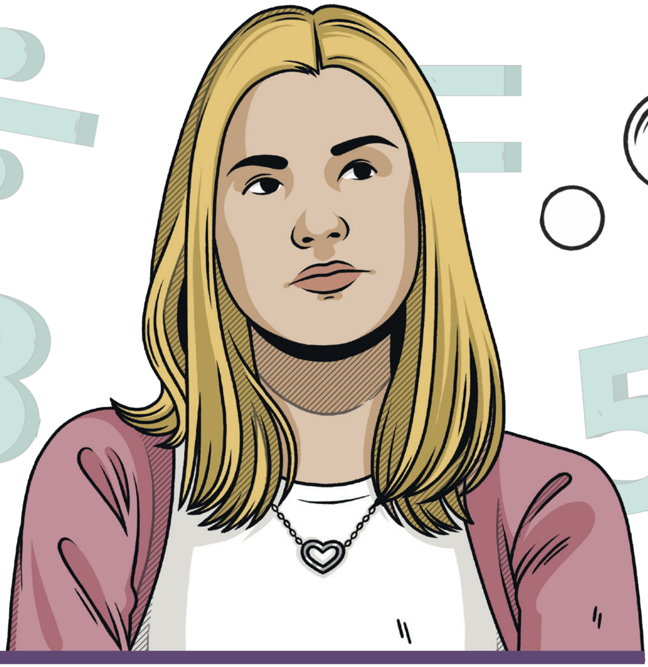
Inverse Operations in Algebra

Using Addition

Algebra is a type of maths where the values in an equation are unknown equation. The unknown part may be represented by a letter or symbol.

Our task is to find the value of the unknown.



In this case we need to find out x.

$$x \quad - \quad 19 \quad = \quad 29$$

The inverse operation of addition is subtraction.

So if x - 19 = 29 that means 29 + 19 will equal x.

If we change the equation to read like this:

x = 29 + 19

Now we can solve it:

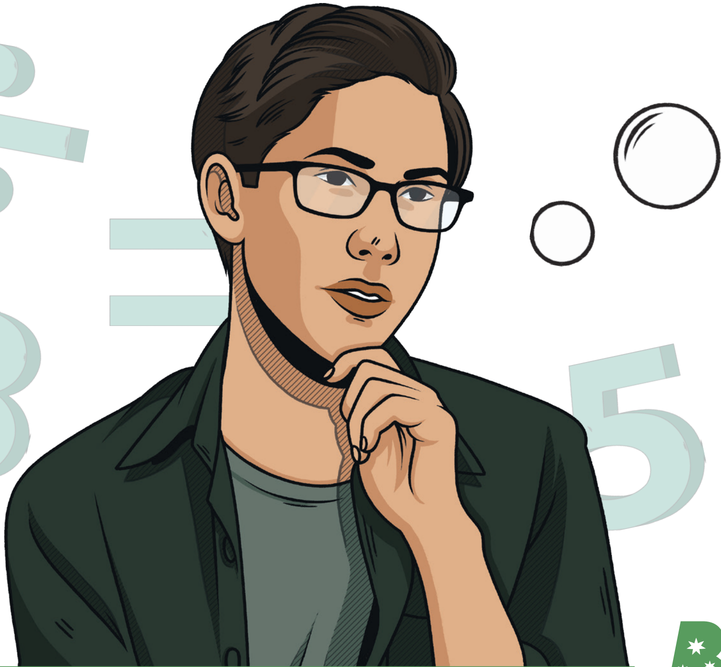
x = 48

Inverse Operations in Algebra

Using Multiplication

Algebra is a type of maths where the values in an equation are unknown. The unknown part may be represented by a letter or symbol.

Our task is to find the value of the unknown.



In this case we need to find out x.

$x \div 9 = 3$

The inverse operation of division is multiplication.

So if $x \div 9 = 3$ that means 3×9 will equal x.

If we change the equation to read like this:

$x = 3 \times 9$

Now we can solve it:

$\mathbf{x = 27}$
