

Solving a Simple Algebraic Equation

In algebra, a letter is used to represent an unknown number.
This letter is called a pronumeral.

Take a number.

n

Let's call this number '*n*'.

Multiply it by 2.

2 × *n*

In algebra we get rid of the multiplication sign and simply write $2n$.

Add 3.

2*n* + **3**

$$2n + 3 = 11$$

This is called an equation.

Solving an Algebraic Equation

Solving an algebraic equation means finding the value of the pronumeral. To do this, we perform the inverse operation on both sides of the equation.

$$2n + 3 = 11$$

Subtract 3 on both sides of the equation.

$$2n + 3 - 3 = 11 - 3$$

$$2n = 8$$

Divide each side by 2 to find *n*.

$$2n \div 2 = 8 \div 2$$

$$n = 4$$

You have now found *n*.
